Remote Monitoring for Implantable Cardioverter Defibrillator (ICD)

Sunnybrook
SCHULICH HEART CENTRE

What is remote monitoring?

Remote monitoring means that our arrhythmia device specialists can help make sure your Implantable Cardioverter Defibrillator (ICD) is working properly without you needing to come into the hospital.

You will need to visit the Arrhythmia Device Clinic for an in-person appointment at least once a year to test your device.

PLEASE NOTE:

The remote monitoring system is not an emergency information system and does not substitute for medical treatment in the case of an emergency.

If you feel unwell, see your family doctor or visit your nearest emergency room for urgent matters. Please inform the emergency room doctor that you have remote monitoring for your device.

How does it work?

1

Your ICD connects to a small transmitter in your home. Keep your transmitter plugged in at all times.

2

The transmitter collects real-time, encrypted data, such as battery status, lead function and shocks.

3

With your consent, the data is sent to our Arrhythmia Device Clinic automatically or at a specific time provided to you by our clinic.

Travelling?

You may take your transmitter with you when you travel, but please inform the clinic of your travel plans.

You may be required to come into the clinic for an in-person evaluation.
